

Assurance evidence and change state

Assurance is useful when data moves between teams, systems or automated workflows and people need a reliable account of its status. Verity can associate an assessment with named rules, source references, versions, evidence and responsible owners. It helps make change visible and supports review, audit and operational decisions without claiming that a check proves every fact is true.

SME / START FOCUSED

Use a focused set of quality rules and a lightweight evidence record for a critical dataset, supplier exchange or AI workflow; add lineage and change monitoring where the risk justifies it.

ENTERPRISE / EXTEND WITH CONTROL

Apply common evidence contracts across data domains and environments. Integrate catalogues, pipelines and approval workflows; retain versioned policy context and traceable assurance events for review.

COMPOSABLE CAPABILITIES

Assurance components can include source and authority references; named data owners; validation rules and results; lineage and version identifiers; change and approval records; signed evidence receipts; and event-based reassessment. Data remains authoritative in the customer's approved source system unless an explicit design says otherwise.

A PRACTICAL FIRST MILESTONE

Start with a bounded scope, named owner and evidence of value.

From authenticated intent to controlled action and evidence.

Probabilistic systems may interpret or recommend. They do not grant themselves authority. The Orchestrator coordinates context and assessments; deterministic policy decides, and enforcement happens at the action boundary.

THIS PRODUCT'S ORCHESTRATOR INTERFACE

The Orchestrator supplies a bounded request and the context needed for an assessment. Verity or its assurance adapter returns structured, versioned evidence—such as source reference, validation outcome, rule set, lineage, timestamp and change state—for the relevant policy domains and PDP. Counterpoise uses that evidence in its decision and enforcement flow; Verity does not make the final execution decision or certify source truth.

DEPLOYMENT OPTIONS

- Azure profile** — strategic enterprise route.
- Heroku profile** — lower-operational-overhead SME and controlled-exception route.
- Hosted SaaS or private/dedicated** — tenancy and service model depend on validated implementation.
- Hybrid or on-premise** — customer-specific technical assessment required; not implied as generally available.

The intended profiles retain common contracts, policy semantics, reason codes and conformance tests. Identity, residency, keys, networking, integrations and resilience are set for the customer environment.

VERITY

DATA ASSURANCE

Know what
you can trust.

- PROVENANCE
- VALIDATION
- ASSURANCE
- CONFIDENCE
